

The Ultimate Guide to Business Process Management

Mittwoch, 3. September 2025 11:26

General Ideas

- As long as you have Process Management you can always adapt, regardless the environment
- BPM is about improving the way work gets done

Introduction

- BPM has 5 functions

Function analysis:	Assesses functions, guides strategy, finds growth.
Service analysis:	Identifies manual tasks, prepares for automation.
Process analysis:	Reviews end to end processes, finds improvements.
Information analysis:	Maps info flow, finds gaps, optimizes channels.
Workflow analysis:	Assesses data flow across apps, networks, systems.

The book focusses on Process Analysis since the other functions of BPM are usually performed by IT sperialcists

5 Tasks to take in BPM

Business Strategy	<ul style="list-style-type: none">Defines long term direction and growth opportunities.Creates road maps and blueprints for the organization.
Business Architecture	<ul style="list-style-type: none">Designs structures, roles, governance, and systems needed to realize the strategy.
Business Process Management (BPM)	<ul style="list-style-type: none">Models end to end processes from customer to customer.Ensures efficiency and cost effectiveness in daily operations.
Lean	<ul style="list-style-type: none">Identifies and removes waste in processes.Improves speed and visual management of operations.
Six Sigma	<ul style="list-style-type: none">Uses data and statistics to measure process performance.Reduces variability and optimizes efficiency.

BPM Center of Excellence (CoE)

4 Layers of CoE

Performance Layer	Sets BPM goals and best practices. Manages repository, ensures consistency, reviews projects, drives savings.
Business Layer	Defines how the CoE is run. Covers people, process, governance, technology as the four pillars.
Service Layer	Provides services like training, modeling, analysis. Clarifies roles and responsibilities of BPM teams.
Technology Layer	Maintains central process repository and BPM tools. Ensures standards, version control, single source of truth.

4 Pillars of BPM CoE

People Defines roles, skills, and responsibilities. Ensures the right expertise is available to drive BPM initiatives.	Process Provides the methods, standards, and frameworks for how processes are modeled, improved, and managed. Process Modeling Techniques <table><tr><td>Process Maps</td><td>Static flat drawings, isolated view, time intensive, no dynamic changes.</td></tr><tr><td>Process Models</td><td>Dynamic, tool based, end to end, changes cascade, allow simulations.</td></tr><tr><td>Flowcharts</td><td>Basic standard, sequential flow, simple notation, one behavioral view.</td></tr><tr><td>RACI Matrix / Functional Decomposition</td><td>RACI clarifies stakeholder roles. Functional decomposition lists processes with owners before modeling. who needs to be responsible, accountable, consulted and informed</td></tr></table> Business Process Management Notation (BPMN) = The standardized way to document business processes <table><tr><td>Flow objects</td><td>Events start or end processes, activities are tasks, gateways split or merge flows. <div>Event</div><div>Activity</div><div>Gateway</div></td></tr><tr><td>Connecting objects</td><td>Link tasks through sequence flows, message flows, and associations. Show the flow of information <div>Sequence Flow</div><div>Message Flow</div><div>Association</div></td></tr><tr><td>Swim lanes</td><td>Organize activities by participants (pools) and roles (lanes). <div>Pool</div><div>Swim Lane</div></td></tr><tr><td>Artifacts</td><td>Add context with data objects, groups, and annotations. <div>Data Object</div><div>Group</div><div>Text Annotation</div></td></tr></table> Create a Process Hierarchy Collect every process model used in the organization. <ol style="list-style-type: none">Tag each process with a unique ID for consistent placement.Apply APQC's Process Classification Framework (PCF) as best practice taxonomy.Connect processes directly to business services, products, and activitiesStandardize naming, structure, and avoid ad hoc development.Arrange processes in a tree structure with clear classes and categories.Enable staff to see gaps, overlaps, and relationships across business lines Organization Value Chain Operations: <ol style="list-style-type: none">ProcurementInbound LogisticsProduction	Process Maps	Static flat drawings, isolated view, time intensive, no dynamic changes.	Process Models	Dynamic, tool based, end to end, changes cascade, allow simulations.	Flowcharts	Basic standard, sequential flow, simple notation, one behavioral view.	RACI Matrix / Functional Decomposition	RACI clarifies stakeholder roles. Functional decomposition lists processes with owners before modeling. who needs to be responsible, accountable, consulted and informed	Flow objects	Events start or end processes, activities are tasks, gateways split or merge flows. <div>Event</div> <div>Activity</div> <div>Gateway</div>	Connecting objects	Link tasks through sequence flows, message flows, and associations. Show the flow of information <div>Sequence Flow</div> <div>Message Flow</div> <div>Association</div>	Swim lanes	Organize activities by participants (pools) and roles (lanes). <div>Pool</div> <div>Swim Lane</div>	Artifacts	Add context with data objects, groups, and annotations. <div>Data Object</div> <div>Group</div> <div>Text Annotation</div>	Governance = Directing and organizing activities around processes between business and IT • Establishes rules, oversight, and decision making to ensure BPM is consistent, compliant, and aligned with strategy. • Clearly describe the roles and rules of the system in a set of documents BPM Activity Cycle <table><tr><td>Define</td><td>Client submits formal work request. CoE manager approves before work begins.</td></tr><tr><td>Design</td><td>Analyst drafts process model with client input. Only draft model is delivered.</td></tr><tr><td>Simulate</td><td>Test model using tool, workshop, or external reviewer. Identify issues and gather feedback.</td></tr><tr><td>Deploy</td><td>Roll out process with business architects and stewards. Train and brief stakeholders.</td></tr><tr><td>Execute</td><td>Make process operational. Provide support and resolve early problems. May phase rollout.</td></tr><tr><td>Monitor</td><td>Collect feedback through reports, surveys, or workshops. Check results against expectations.</td></tr><tr><td>Analyze</td><td>Review and assess feedback. Run further simulations if needed. Agree on recommendations.</td></tr><tr><td>Optimize</td><td>Implement improvements and create procedure documentation.</td></tr></table> Checklist for Standards Modeling • Create a functional decomposition matrix first to ensure end-to-end view and avoid rework Formatting • Use BPMN 1.2 or 2.0 so models support metrics and automation • Keep all notation symbols same size for consistency • Space symbols evenly for clarity • Place model title at top center for identification • Add hierarchy number top right to align with process architecture • Add version and last edited date bottom right for traceability • Add author name bottom left to show ownership and contact point Gateways • Use exclusive gateways when only one path is followed • Use inclusive gateways when one or more paths can be followed • Use parallel gateways when all paths must be followed • Ensure criteria are clear and percentages add up to 100% Tasks / Activities / Sub-processes • Break down tasks into sub-processes if needed for detail • Keep sub-processes self-contained with no flows crossing boundaries • Label tasks with verb-noun format, max four words, to describe action clearly Events • All processes must start and end with events • Label events with trigger description for clarity Flows • Message flows connect tasks or events, not gateways • Sequence flows connect elements in same pool • Message flows used only between pools • Avoid overlapping lines to keep flow easy to read Other • All diagram elements must connect to the process, no floating shapes • Document the full end-to-end process for redesign and improvement	Define	Client submits formal work request. CoE manager approves before work begins.	Design	Analyst drafts process model with client input. Only draft model is delivered.	Simulate	Test model using tool, workshop, or external reviewer. Identify issues and gather feedback.	Deploy	Roll out process with business architects and stewards. Train and brief stakeholders.	Execute	Make process operational. Provide support and resolve early problems. May phase rollout.	Monitor	Collect feedback through reports, surveys, or workshops. Check results against expectations.	Analyze	Review and assess feedback. Run further simulations if needed. Agree on recommendations.	Optimize	Implement improvements and create procedure documentation.	Technology Supplies the tools and repositories that support modeling, automation, monitoring, and knowledge sharing.
Process Maps	Static flat drawings, isolated view, time intensive, no dynamic changes.																																		
Process Models	Dynamic, tool based, end to end, changes cascade, allow simulations.																																		
Flowcharts	Basic standard, sequential flow, simple notation, one behavioral view.																																		
RACI Matrix / Functional Decomposition	RACI clarifies stakeholder roles. Functional decomposition lists processes with owners before modeling. who needs to be responsible, accountable, consulted and informed																																		
Flow objects	Events start or end processes, activities are tasks, gateways split or merge flows. <div>Event</div> <div>Activity</div> <div>Gateway</div>																																		
Connecting objects	Link tasks through sequence flows, message flows, and associations. Show the flow of information <div>Sequence Flow</div> <div>Message Flow</div> <div>Association</div>																																		
Swim lanes	Organize activities by participants (pools) and roles (lanes). <div>Pool</div> <div>Swim Lane</div>																																		
Artifacts	Add context with data objects, groups, and annotations. <div>Data Object</div> <div>Group</div> <div>Text Annotation</div>																																		
Define	Client submits formal work request. CoE manager approves before work begins.																																		
Design	Analyst drafts process model with client input. Only draft model is delivered.																																		
Simulate	Test model using tool, workshop, or external reviewer. Identify issues and gather feedback.																																		
Deploy	Roll out process with business architects and stewards. Train and brief stakeholders.																																		
Execute	Make process operational. Provide support and resolve early problems. May phase rollout.																																		
Monitor	Collect feedback through reports, surveys, or workshops. Check results against expectations.																																		
Analyze	Review and assess feedback. Run further simulations if needed. Agree on recommendations.																																		
Optimize	Implement improvements and create procedure documentation.

BPM Maturity Model

0. Non-existent	No BPM maturity, issue not recognized.
1. Initial	Issue recognized but only ad hoc, disorganized approaches, reliant on individuals.
2. Managed	Similar procedures within tasks, weak documentation, no training, errors likely.
3. Standardize	Processes documented, trained, and mandated. Focus on consistency and basic automation.
4. Predictable	Processes monitored and measured. Results predictable, partial use of BPM tools.
5. Innovating	Fully optimized and integrated. Continuous improvement, strong IT support, adaptive enterprise.
